

Can Chinese bees survive without storing honey in supers

By adding extra boxes to your hive, you provide your bees with more space to store excess honey, resulting in a higher overall harvest. For example, if you have a colony that typically ...

Your bees will not fill empty honey supers until conditions are right and they are ready. Trying to overload the bees' agenda may backfire.

When conditions are perfect, bees can fill honey supers in 2 to 3 days, so it will be important to stay ahead of the storage needs of your hive by supering. Honey production depends on the quality of the ...

Bees only store surplus honey when they are collecting more nectar than they need for their immediate daily operations. If there is no significant nectar flow, they have no reason to expand into a super. ...

However, a honey super can be left on a beehive if the colony is strong and the winter temperatures are not harsh enough to warrant removal. Removing honey supers from your beehives is part of routine.

Within hours, the new colony's bees build new wax brood combs using honey stores with which the young bees have filled themselves before leaving the old hive. Only young bees can secrete wax ...

Nadir the super in autumn and remove in early spring: by winter, bees will have shifted the honey next to them as they wish. A super above makes bees work to compensate for the loss of ...

When honey is stored on either side of the brood nest with comb positioned between the cluster and their food source, cold temperatures can prevent the bees from reaching their honey.

Freezing frames is not necessary for storage, and uncapped honey will kill bees over winter. Instead, they can be fed back honey from their own supers or sugar syrup.

First, inspect each super to ensure that all frames are empty of honey. Any remaining honey can be extracted using a honey extractor or by allowing the bees to clean out the frames in ...
