

What type of Breaker is used in a substation?

This type of breaker uses compressed air to extinguish the arc that is created when the contacts open. Air blast breakers are generally used for voltages above 38 kV. Another type of circuit breaker that can be used in a substation is the oil circuit breaker. This type of breaker uses oil to quench the arc created when the contacts open.

What does a circuit breaker do in a substation?

Circuit breakers perform two fundamental roles in substations: (1) interrupt high fault currents safely to protect equipment and limit system disturbance, and (2) provide a means of making and routing power during normal operation (switching, sectionalizing).

How does a substation breaker make decisions?

A substation breaker does not make decisions on its own. It responds to inputs from current and voltage transformers and from protective relays that continuously evaluate system conditions. When thresholds are exceeded, the relay issues a trip command, and the breaker executes it.
