

# Finland forest fire prevention communication base station wind and solar complementarity

Using a qualitative comparative approach based on a literature review and policy document analysis, this study aims to examine the wildfire management systems and practices in ...

Last week, a new kind of technology was tested in Finland to help suppress wildfires. Drones and AI can help rescue professionals significantly in detecting wildfires, coordinating the ...

Finland is the only country in the world whose forests have been mapped down to every single tree, stump and stem. When there is enough data, artificial intelligence can help prevent forest ...

According to Honkavaara, research related to forest fire prevention continues to be active both in Finland and globally. For example, larger drone models are being developed, and in the ...

Correlation analysis highlights the complementary nature of solar and wind energy in the Nordic conditions, with seasonal and daily patterns supporting their synergistic potential to stabilize ...

The reduced number of forest fires in Finland is largely due to good forest management and a forest road network that not only makes it possible to acquire wood raw material for the forest ...

This work proposes the design and implementation of a real-time forest fire detection and alert system utilizing wireless sensor networks (WSN) and solar energy

This article explores how technology can improve natural disaster management in Finland, making a connection with European areas that, like Finland, were historically less bound to ...

To create more fire resilient forests and societies in a changing climate, there is a need to actively identify fire risk in the Nordic forests and include fire mitigation as part of forest ...

In some cases, fire detection systems are also paired with wind-solar hybrid setups, increasing year-round energy availability and reducing downtime in variable climates.
