

In the solar-industry shakeout which took place in the first half of the 2010s, the country's biggest manufacturer went bankrupt owing to debts and overcapacity.

Photovoltaic (PV) technologies dominate China's solar industry, with roughly 99% of China's solar power capacity. Chinese PV manufacturing accounts for the vast majority of global PV production.

In 2023, China's new energy investment grew rapidly, the investment in solar PV exceeded 670 billion CNY, while the investment in wind power exceeded 380 billion CNY.

Over the past few years, Chinese solar manufacturers have undertaken an extraordinary investment surge that's given a big boost to global green energy deployment and hammered home ...

The most exciting possibility for solar energy is satellite power station that will be transmitting electrical energy from the solar panels in space to Earth via microwave beams.

The study reveals that the actual power generation per square meter of solar photovoltaic (PV) farms is only one-third of its technical potential due to inefficiencies in technology, ...

In this review, based on the statistical data released by the authorities, the current status of the solar energy curtailment are reviewed with a detailed analysis of the reasons from the aspects ...

China is adding more solar and wind power to its energy grid than any other economy - but that huge buildout has its challenges. Here's what we can learn

With the increase of installed capacity of photovoltaic power plants, the power fluctuation of photovoltaic power generation is large, and the high power factor operation of the inverter poses a threat to the ...

China has produced an excess of solar panels, causing overcapacity issues domestically and abroad. The US, the European Union, and China are facing challenges because of the glut of ...
