

Wind turbine towers range from backyard-friendly 8-meter poles to skyscraper-like 250-meter giants. But here's the kicker - the exact height depends on whether you're powering a farmhouse or an entire city.

As tall as they are, most wind turbines still don't escape the surface layer. The turbines would need to be between 200 to 300 meters in height to reach winds that are relatively undisturbed ...

Industrial wind turbines are a lot bigger than ones you might see in a schoolyard or behind someone's house. The widely used GE 1.5-megawatt model, for example, consists of 116-ft blades atop a 212-ft ...

Guidelines suggest that a tower should be 30' above anything within a 300' radius in order to keep the turbine up in clean, non-turbulent wind. Air is very fluid (like water) - any obstruction to the wind ...

Early wind turbines were relatively small, with hub heights of only a few meters. As technology has advanced, turbine heights have grown dramatically. This trend is driven by the desire ...

Where obstacles are present, the wind turbine rotor should be at least 30 feet above the tallest obstacle within a 500-foot radius. If trees are not fully grown, then the tower height must be adjusted for ...

Wind speeds pick up as you go higher, and doubling the wind speed multiplies available power by eight. The best tower installations usually stand between 24-37 metres (60-120 feet) tall.

When planning a small wind turbine installation, one of the most critical decisions you'll make is where to place it--and how tall the tower should be. These two factors have a huge impact ...

Always be sure to install your wind turbine at least 30' higher than the nearest obstructions. It is also important to keep in mind that a turbine's generator size (generating capacity, ...

A wind turbine's hub height is the distance from the ground to the middle of the turbine's rotor. The hub height for utility-scale land-based wind turbines has increased 83% since 1998-1999, ...
