

How do you use a solar inverter?

o Switch it to the "On" position. This will allow the DC power from the solar panels to flow into the inverter. Next, you'll need to turn on the AC isolator switch, which allows the inverter to send the converted AC power to your home or the grid.

Why should I Turn on my solar inverter?

Turning on your solar inverter is an important step in starting up your solar power system after installation, maintenance, or a reset. The inverter is responsible for converting the DC (direct current) electricity produced by your solar panels into usable AC (alternating current) electricity.

What is a solar inverter?

A solar inverter is the electronic heart of your solar power system--a sophisticated device that converts the direct current (DC) electricity generated by your solar panels into the alternating current (AC) electricity that powers your home and feeds into the electrical grid. Think of it like a translator at the United Nations.

How does a solar inverter work?

Most homes and appliances run on alternating current (AC). This is where the solar inverter comes in. Put simply, a solar inverter converts the DC electricity generated by your solar panels into AC electricity that can be used in your household or fed back into the power grid. Without it, all that solar energy would be essentially unusable.

The inverter will begin to operate according to your settings and convert the energy from the solar panels into usable AC power. Once all electrical connections are made, configure the ...
