

Inspired by the structure and functionality of natural leaves, the PV-leaf is composed of glass, photovoltaic cells, bamboo fibers, and hydrogel cells. Not only does it generate electricity, but ...

Chinese scientists have developed an artificial leaf that can track the sun's movement, mimicking real plant behavior. The artificial leaf combines flexible solar-powered electrodes with a ...

Here, the authors propose a multi-energy generation photovoltaic leaf concept with biomimetic transpiration and demonstrate much improved performance.

Chinese scientists have created an energy generator that harnesses the transpiration of plants to create electricity, which could transform almost all leaves on Earth into a sustainable and...

Scientists in China say they've found a way to use lotus leaves to generate electricity from transpiration--the movement of water evaporating out of a leaf--opening a door to generating clean ...

Scientists have made a breakthrough with an "artificial leaf" energy device. Discover this critical milestone and its transformative potential!

Chinese scientists have developed a transpiration energy generator capable of creating electricity using lotus leaves. The generator could turn nearly all leaves on the planet into a ...

Chinese scientists have developed a transpiration energy ...

Researchers from Imperial College London have invented a new leaf-like design that collects and generates photovoltaic solar energy and produces freshwater by mimicking the ...

In this work, authors convert fallen leaves into energy harvesters using hygroscopic iron hydrogel, achieving continuous power generation from moisture.

Researchers from Imperial College London have made a groundbreaking leap in renewable energy technology with their innovative bio-inspired leaf design. This remarkable ...
