How do roof mounted PV solar panels work?

Roof mounted PV Solar Panels are typically supported by racking systems which come in two basic forms. The first is a mechanically fastened system and the second, the more common of the two, is a ballast restrained system. The mechanically fastened system penetrates through the roofing membrane and can be used in pitched roofs and flat roofs.

Do solar panels need a roof racking system?

Designers must design roofing systems for the structural impact of existing, new and future solar panel installations. Roof mounted PV Solar Panels are typically supported by racking systems which come in two basic forms. The first is a mechanically fastened system and the second, the more common of the two, is a ballast restrained system.

Can a PV system be installed on a flat roof?

Designing and installing a PV system on a flat roof requires careful planning and the adoption of innovative solutions to ensure optimal performance and durability. By using high-quality materials, such as GB Solar's precast concrete PV ballasts, and following best engineering practices, a safe, stable, and efficient PV system can be built.

Can solar panels be installed on a sloped roof?

As well, solar panel installations on sloped roofs can act to trap snow that otherwise may have been considered to slide off the roof structure. Finally, roofing systems installed in new buildings are typically designed to outlast or at least match the average life of the new solar PV system which is about 25 years.
