

How to choose a solar inverter?

Max. PV Power: be sure that the total number of modules are below the inverter's maximum. Max. DC Voltage: be sure that the total modules in series are below, in this case, 600 V total. MPPT operating voltage range / Start Voltage: be sure the minimum module voltage is above the operating MPPT lower range of the start voltage, whichever is higher.

How do you calculate a voltage rating for an inverter?

Simply divide the inverter's maximum system voltage rating by the open circuit voltage (Voc) of the module used and you're good. Well, that does get you in the ballpark, however, you could be at risk of over-sizing or under-sizing the number of modules in a string depending on where you are located in the world.

What to check before string sizing a solar inverter?

Before string sizing we will need to check the inverter limits and peak performance ranges. Example inverter data sheet Max. PV Power: be sure that the total number of modules are below the inverter's maximum. Max. DC Voltage: be sure that the total modules in series are below, in this case, 600 V total.

How to calculate a maximum power limit for a PV inverter?

One method of max current is  $1.25 \times I_{sc}$ . Locate the inverter's maximum PV power and the module's power.  $(4800 \text{ W}) / (360 \text{ W}) = 13$  Maximum number of modules total After calculating the low and high limits, you now can finalize the array configuration within those limits. Here are the results we calculated:
