

Do solar panels need inverters?

As we mentioned in the previous section, solar panels need inverters to convert sunlight into usable electricity (DC to AC). There are two common types of inverters: a string or central inverter, and microinverters like the Enphase IQ8. String inverters connect multiple solar panels in a series.

What is a solar inverter?

A solar inverter is the electronic heart of your solar power system--a sophisticated device that converts the direct current (DC) electricity generated by your solar panels into the alternating current (AC) electricity that powers your home and feeds into the electrical grid. Think of it like a translator at the United Nations.

Which inverter is right for my solar energy system?

As always, our team will help determine the right inverter for your solar energy system, but take a look at these two types of inverters: TruNorth Solar has a long history of working with string inverters, and they remain a fantastic choice for many homeowners.

Do solar inverters really work?

However, inverters do even more than that. Modern inverters also optimize the energy output of your system by providing: System Monitoring: Modern inverters provide monitoring capabilities, allowing homeowners to track the performance of their solar system in real-time, including energy production and system health.
