

What is straight-bladed vertical axis wind turbine (SB-VAWT)?

Straight-bladed vertical axis wind turbine (SB-VAWT) is typical representative of lift type vertical axis wind turbine at present. It has been received more and more attentions in small and medium scale wind energy utilization field due to the advantages of wind direction independence, simple structure, and unique shape.

How to determine the performance of a straight bladed vertical axis wind turbine?

In order to determine the performances of the straight bladed vertical axis wind turbine a genetic algorithm optimizer is applied in addition to an improved version of "Double Multiple stream tube" model.

What is a vertical axis wind turbine?

Darrieus-type vertical axis wind turbines (or VAWTs) have the main rotor shaft arranged vertically and the main components can be located at the base of the turbines.

What is a horizontal axis wind turbine (HAWT)?

The wind is one of the most promising green energy resources that replenishes itself in less than a human lifetime without depleting the planet's resources. According to the disposition of the blade concerning the shaft, wind turbine can be classified as horizontal axis wind turbine (HAWT) and vertical axis wind turbine (VAWT).

Vertical-axis wind turbines have attracted resurged interest across various levels, driven by inherent advantages such as omnidirectional wind acceptance, low acoustic emissions, reduced ...
