

# Where does the electricity generated by rooftop photovoltaic panels go

What is a rooftop solar photovoltaic system?

A rooftop solar photovoltaic (PV) system uses solar panels mounted on the roof of a building to convert sunlight into electricity. Rooftop solar systems rely on the photovoltaic effect, where cells generate electricity in response to sunlight.

How do rooftop solar panels work?

Rooftop solar systems work by harnessing the photovoltaic effect. This phenomenon occurs when sunlight hits the multiple cells within solar panels, generating an electric current. By placing panels on a rooftop, solar panels are optimally exposed to sunlight and produce enough electricity to power homes and buildings.

What are the different types of rooftop solar PV systems?

The three main types of rooftop solar PV systems are off-grid rooftop solar systems, on-grid rooftop solar systems and hybrid solar systems (grid-tied with battery). Off-grid rooftop solar systems include a solar battery to store excess energy, so owners have backup power during periods of low sun.

How do you install a rooftop solar PV system?

Take the wires from each solar panel and connect them to the solar inverter, which converts the electricity generated by the array from DC into AC, and then connect the solar inverter to the electrical panel. What are the things to consider before installing Rooftop Solar PV Systems?
