

How to hoist a wind turbine safely?

Because the lifting height, load and lateral dimension during the safe hoisting process of the wind turbine are relatively large, the special jib structure of the all-terrain crane for hoisting wind turbine safely is adopted to solve the problem of interference between the crane jib and the wind power equipment.

How to hoist a land turbine generator?

The special jib for safety hoisting of land turbine generator mainly includes main jib head, sub-jib bracket and front and rear pull plate and so on, which consists of a combination of truss and plate girder structures, as shown in Fig. 2. L is hoisting wind turbine generator all-terrain crane special jib length.

Why is all-terrain crane necessary for hoisting land wind turbines?

All-terrain crane is indispensable for hoisting land wind turbines safely. Because the lifting height, load and lateral dimension during the safe hoisting

Why do wind turbine cranes not work properly?

Because cranes often appear to be affected by high wind speeds, they may not work properly. On the basis of the specific model of the wind turbine generator, the safety hoisting can be carried out using the corresponding all-terrain crane operating conditions.

TYPICAL APPLICATIONS o Lifting equipment for construction of wind turbines o Tool hoists for wind turbine applications o Generator kite winches o Ship pulling kite winches o Positioning ...

For operators in the field, and for the wind power industry in general, the technological innovation brought about by the self-hoisting crane has a positive impact on maintenance activities ...

Overhead Crane & Gantry Cranes for Wind Power Turbine Hoisting Overhead Crane and Gantry Cranes in Wind Power Industries This article highlights the crucial role that overhead and ...

The utility model provides a hoisting device for a direct-driven wind power generator set, which relates to wind power generation and aims at solving the problems of long construction period, high cost and ...

Both geared and direct drive turbines will present challenges in relation to using self-hoisting cranes for major component exchange. Self-hoisting cranes could be used across both ...

Recently, the 10MWD230 onshore large power wind turbine developed independently by CRRC completed hoisting. It is an important model launched for the "Desert and Gobi" wind power ...

Abstract All-terrain crane is indispensable for hoisting land wind turbines safely. Because the lifting height, load and lateral dimension during the safe hoisting process of the wind turbine are ...

[China's first offshore wind power competition project unit completed hoisting]Recently, China's first

competitive configuration project, Shanghai Fengxian Offshore Wind Power Project, successfully ...

Abstract With the transformation and upgrading of the global energy structure, the construction of new energy wind power projects has received more and more attention. As a key link ...
